PROFESSIONAL PROFILE

Senior Product Designer with **9 years of experience** turning complex business problems into solid information architecture and flows that people can actually work with: insurance ERP, digital banking, fintech and mobility. My speciality is **B2B products sold to many clients at the same time**: for four years I was the **only designer in a group with five products**. The core is a multi-tenant SaaS platform that supports different business rules, currencies, languages and brands without forking it per client. I build design systems with usage rules and decision criteria, not only component libraries. Hybrid profile: I have a 5-year university degree in Computer Science, I review the React implementation and I prototype with AI; my portfolio is a Next.js project with tests and public code. Four years presenting and defending proposals to the Product Owners of client companies.

SKILLS

- Multi-tenant products and **white-labeling**: theme, wording and language as per-client configuration
- Design of **configuration layers**: product catalogue, decision rules, schema-defined forms and multi-step wizards
- Information architecture and critical flows in dense, regulated domains
- Scalable design systems with governance, usage criteria and parity with code that can be audited
- Dense B2B products: tables as a workspace, long step-by-step processes and UI that changes with permissions
- **WCAG 2.2 AA** accessibility as an entry requirement, not as a goal
- Client discovery and defending proposals to Product Owners
- Comparing real alternatives as a way to decide
- Research and validation with data from real use
- Design of onboarding, activation, security and authentication in a regulated environment
- Interactive prototyping and handoff followed through to production
- Generative AI applied to the design process and to implementation

TOOLS AND TECHNOLOGY

Design and prototyping: Figma (advanced), FigJam, interactive prototypes, Adobe Photoshop, Adobe Illustrator.

Research and analytics: Microsoft Clarity, Maze, discovery sessions with clients and stakeholders.

Code: HTML and CSS. In my portfolio, React, Next.js and TypeScript, with the implementation directed with AI, tests (Vitest) and an accessibility audit (axe). Daily collaboration with React, React Native, Chakra UI, Tailwind CSS, Flutter, Symfony, Laravel, Android and iOS. WordPress.

AI: interactive prototyping, exploring alternatives, summarising research, documenting flows and front-end implementation directed with Claude.

KEY ACHIEVEMENTS

- I designed the product that today has **165 screens across 8 business areas**, with **12 languages and brand locales** and an interface shaped by **347 permissions**, held together by a single design system and with no separate version per client.
- I found the lack of consistency between modules, proposed a design system and built it from scratch. I started with an audit of the monorepo: **267 colour values reduced to 24 tokens**, each with a role, adopted by **all four front-end developers**.
- I moved client customisation **out of the code and into configuration**, with the product catalogue, decision rules and forms defined as data. Adding a new company no longer needs a branch of the product, and when you issue a policy the visible fields per step go down **from 60 to 14**.
- **The only designer of five products with one design language**: HERMES and its admin module, electronic invoicing (Flesip), a 360 policy system, user and permission management and an e-commerce line.
- I kept **weekly contact for 4 years** with the Product Owners of client companies, running discovery sessions and presenting **2-3 alternatives per initiative** so that each business rule fitted without breaking the product apart.
- I freed up **36% of my design time in 8 months** and used it to analyse real usage patterns with Microsoft Clarity, moving from 1 proposal per initiative to 2-3 alternatives compared with the client.

PROFESSIONAL EXPERIENCE

Senior Product Designer | Atrinium · Málaga, Spain

May 2022 – August 2026

Multi-tenant B2B SaaS for the insurance sector: the HERMES platform and the group's products

- The only Product Designer in the group. I defined the **information architecture and the critical flows** of HERMES: underwriting, policies, claims, receipts, commissions, settlements, CRM and reporting, as well as tasks, authorisations, documents and data import.
- I designed the platform as a **white-label product**: the brand, the wording and the language of each company travel through semantic tokens and language catalogues, without duplicating components or forking the design.
- I designed the **configuration surfaces** that let the business side assemble insurance products, decision rules and questionnaires without custom development. This is the part that decides whether a multi-client SaaS scales or falls apart.
- I proposed and built the **design system** from scratch: components, tokens, type hierarchy, colour rules and iconography, documenting when to use each pattern and when not to, with WCAG 2.2 AA accessibility and an audit of parity between Figma and code.
- I presented and defended every proposal to the Product Owners of client companies, with **1-2 hours of discovery** before designing each new process. I based the decisions on **real usage data** analysed with Microsoft Clarity and documented the flows as interactive prototypes, so that developers could build without guessing.
- Beyond the core: the **client onboarding module** (from a manual process in spreadsheets to production in five weeks), the proposal editor, the client 360 view and the whole **Flesip** product: app, website and the accountant's portal.

UI / Product Designer | Darien Technology · Panama (remote)

February 2021 – May 2022

Technology consultancy: digital banking project for Mercantil Banco Panamá

- I designed flows, online banking prototypes and sales material for the financial products of an external client: digital payments, the Mony app, Tadelanto, Next Gen, mortgages, loans, credit cards and vehicle finance.
- I solved **onboarding, activation, security and authentication** in a regulated mobile product, validating prototypes with Maze before moving to development.
- I applied the bank's design system with judgement and validated every screen before development: unmoderated tests, my own interviews and sessions with Marketing for the transactional emails. I presented the proposals to the client.

Earlier and freelance experience

March 2017 – December 2020

Taksio Technologies (UX/UI Designer, Caracas · 2017-2019) · Geekconic (Zulia · 2019) · International freelance (2019-2020) · RedBird Smart Tracker (Caracas · 2017)

- I built from scratch the design system and the operational flows of a **multimodal mobility platform**: passenger and driver apps plus operations dashboards.
- I ran client projects from start to finish as a freelancer for fintech, banking and international logistics, and also did the information architecture and the web design system for a client in retail.

EDUCATION

5-year university degree in Computer Science · Universidad de Oriente, Cumaná, Venezuela · 2017

LANGUAGES

Spanish (native) · English B1, actively studying towards B2
